By Neville Hodgkinson | *The Conservative Woman* | June 7, 2021

I' LL LEAD you into this article gently, since I' m sure many readers will have had the Covid jab, persuaded by the unremitting propaganda from the NHS and most media sources that it is safe and effective.

The reality as the science of it unravels is that for some it is neither.

I had strongly hoped that it really would be an answer to Covid-19. Despite high levels of immediate reactivity (four out of five in the Pfizer vaccine trial report had mild to moderate side-effects), the manufacturers' argument that this was a sign of a healthy immune response seemed logical.

We now know differently.

The healthiest response to the virus is for the body to develop natural immunity, which fortunately is what most people do, either with only mild symptoms or no illness at all.

As thousands of doctors have argued, public health efforts should be directed towards strengthening immunity among the vulnerable. Support should be focused on those with a poor diet or other factors putting their immune health at risk, including lack of sunshine and loneliness – the exact opposite of what we saw imposed on the elderly during lockdown.

The reason why this kind of support is so important is that once the virus takes hold, the unique 'extras' it carries as a result of its genetically engineered origins bring long-term risks as well as immediate harm, including effects ranging from blood clots and heart disease to brain damage and reproductive issues.

As many will know by now, the problem lies within a structure that enables the virus, originally from bats, not only to enter human cells but to deliver a toxin called the spike protein.

Most Covid vaccines instruct our body cells to produce the same protein. This is in the hope that antibodies developed against it will prevent the most damaging effects of the actual virus. There is evidence that this is the case for some.

But there' s also a problem, spelled out most recently by Canadian researcher Dr Byram Bridle, who was awarded a \$230,000 Ontario government grant last year for research on Covid vaccine development.

This is that the spike protein produced by the vaccine does not just act locally, at the site of the jab (the shoulder muscle), but gets into the bloodstream and is carried through the circulation to many other sites in the body. Previously confidential animal studies using radioactive tracing show it to go just about everywhere, including the adrenal glands, heart, liver, kidneys, lungs, ovaries, pancreas, pituitary gland, prostate, salivary glands, intestines, spinal cord, spleen, stomach, testes, thymus, and uterus.

The quantities are small and usually disappear within days.

But the questions arise, is this mechanism involved in the thousands of deaths and injuries reported soon after Covid vaccination, and might it set some people up for the same long-term consequences as in severe cases of the disease itself?

Some researchers say the risk from the vaccine may be greater than that from the actual virus in healthy people. This would be especially true for the young, whose immune systems deal with the

virus successfully. In contrast, the vaccine has a device that protects the spike protein mechanism against immediate destruction by the body, in order to promote the immune response.

Although millions have received the jab without ill-effects, there have been thousands of reports of deaths and disease associated with it. The symptoms are often indistinguishable to those induced by the virus, and so there is real concern that this **damage** is being missed by manufacturers and regulators as being related to the vaccine.

Dr Bridle, associate professor of viral immunology at the University of Guelph, Ontario, summarised his concerns in an **interview** with Toronto radio host Alex Pierson on May 28.

‘I’ m very much pro-vaccine, but always making sure that the science is done properly and that we follow the science carefully before going into public rollout of vaccines,’ he said. ‘I’ ll forewarn you and your listeners that the story I’ m about to tell is a bit of a scary one. This is cutting edge science. There’ s a couple of key pieces of scientific information that we’ ve been privy to, in the past few days, that has made the final link, so we understand now – myself and some key international collaborators – we understand exactly why these problems [with the vaccine] are happening.’

One of these ‘is that the spike protein, on its own, is almost entirely responsible for the damage to the cardiovascular system, if it gets into circulation. Indeed, if you inject the purified spike protein into the blood of research animals they get all kinds of damage to the cardiovascular system, and it can cross the blood-brain barrier and cause damage to the brain.

‘At first glance that doesn’ t seem too concerning because we’ re injecting these vaccines into the shoulder muscle. The assumption, up until now, has been that these vaccines behave like all of our traditional vaccines: they don’ t go anywhere other than the injection site, so they stay in our shoulder. Some of the protein will go to the local draining lymph node in order to activate the immune system.

‘However – this is where the cutting edge science has come in, and this is where it gets scary – through a request for information from the Japanese regulatory agency, myself and several international collaborators have been able to get access to what’ s called the biodistribution study. It’ s the first time ever that scientists have been privy to seeing where the messenger RNA vaccines go after vaccination; in other words, is it a safe assumption that it stays in the shoulder muscle? The short answer is, absolutely not. It’ s very disconcerting. The spike protein gets into the blood and circulates over several days post-vaccination.’

The study was conducted for Pfizer by Japanese researchers. Bridle said its results are backed up by a **paper** just accepted for publication reporting that 11 of 13 young health workers who received two doses of the Moderna RNA vaccine showed detectable levels of the virus protein in their blood within a day of their first injection.

‘We have known for a long time that the spike protein is pathogenic,’ Bridle said. ‘It is a toxin. It can cause damage in our body if it’ s in circulation. Now, we have clear-cut evidence that . . . the vaccine itself, plus the protein, gets into blood circulation.’

Once that happens, the spike protein can combine with receptors on blood platelets and with cells that line our blood vessels. This is why, paradoxically, it can cause both blood clotting and bleeding. ‘And of course the heart is involved, as part of the cardiovascular system,’ Bridle said. ‘That’ s why we’ re seeing heart problems. The protein can also cross the blood-brain barrier and cause neurological damage. That’ s exactly why we’ ve been seeing clotting disorders associated with these vaccines.’

In another study, not yet accepted for publication, researchers found ‘inadvertently’ that RNA vaccine particles are transferred to babies through breast milk (they had been trying to show that antibodies in vaccinated mothers were passed on to the babies).

Doctors are concerned that that once the spike protein gets into circulation, it will become concentrated in breast milk. It could also be a hazard for fragile patients receiving blood transfusions.

‘Looking into the adverse event database in the US, we have found evidence of suckling infants experiencing bleeding disorders in the gastro-intestinal tract,’ Bridle said.

‘In short, the conclusion is that we made a big mistake. We didn’ t realise it until now. We didn’ t realise that by vaccinating people we are inadvertently inoculating them with a toxin. In some people this gets into the circulation; and when that happens, in some people it can cause

damage, especially to the cardiovascular system. I have many other legitimate questions about the long-term safety of the vaccine.'

Bridle is a member of the Canadian Covid Care Alliance, a group of independent doctors, scientists and health care practitioners 'committed to providing top-quality and balanced evidence-based information to the Canadian public about Covid-19 so that hospitalizations can be reduced, lives saved, and our country safely restored as quickly as possible.'

The group has produced this [guide](#) as to 'why parents, teens and children should question the Covid-19 vaccine' .

Last week, Britain's regulators approved the Pfizer jab for 12-15-year-olds, concluding it is 'safe and effective in this age group and that the benefits of this vaccine outweigh any risk' . As Sally Beck wrote in TCW [here](#), several high-profile experts questioned the ethics of the decision, which came even as 93 doctors in Israel – a testing ground for the same vaccine – wrote to their government begging them not to use it on children.

Disturbing news (to say the least) Tony
Maybe Hitler promising to “lead” the German people to salvation
was the biggest con the world had seen, or the Death camps (supposedly a ‘work camp’)
or the 911 fiasco and aftermath but this “covid thing” still has legs...
it and it’ s aftermath gonna do a lot of damage for sure

We should stick to Astrazeneca or Spunik and have nothing to do with the mRNA
technology. This is a worthwhile precaution. At least the spike protein injected into our bodies
will be precisely controlled both in amount and in localization.

mRNA technology from the beginning reminded me of Hitler being sent to infiltrate the
German Worker Party ending up being the leader of a new Nazi Party. Can we trust the
mRNA to not messing around ?
